

1. Data Cloud Integration

Following the integration of Amazon S3 and Salesforce CRM within Data Cloud, we created unique profiles stored in the *UniqueIndividuallink2* object. This object holds references to both Amazon S3 and Salesforce, serving as a unified unique identifier.

2. Service Agent & Order Tracking

To allow customers to track their order information, we built a service agent hosted on a chat widget. We then developed an action for this agent using an Apex class to fetch order information. The Apex class retrieves order records based on the customer's email address. You can review the attached code on GitHub to see how data is accessed from the Data Cloud object.

Assign_To_Agent

Description

Set Input Values

* How Many Work Records to Route? ⓘ
☒ Single
☐ Multiple

* Record ID Variable
{RecordId}

* Service Channel
Messaging

* Route To
Agentforce Service Agent

* Agentforce Service Agent
Portal Assistance Agent

Fallback Queue
☒ Select Queue
☐ Use Variable

* Fallback Queue ID
Agent Chat Queue

Set Additional Input Values

3. Flow & Omni-Channel Routing

Next, we configured a flow similar to the setup used when assigning cases to Omni-Channel. The flow routes incoming work to the service agent. If the service agent fails to respond, the query is automatically redirected to a queue assigned to human agents via routing configuration and capacity models.
